

KisanChill: The Problem and Our Idea

Pay-per-use solar cold storage so small farmers stop losing crops and income

KisanChill

Solar cold storage at the farm gate

ChillPod: a solar cold room right at the farm gate

The problem

- Small farmers must sell fresh produce within days, so everyone sells at once and **prices crash** at harvest.
- Cold storage is far from villages and built for big traders, so produce **spoils** on the way.
- Farmers lose income, and less food reaches the market.

20%

of some crops spoil without cold storage
(sample assumption)

Our solution

- Small **solar-powered cold rooms** (ChillPods) placed right where farmers harvest.
- Farmers rent space **per kg, per use**. No big investment and no electricity bill.
- An app gives **price alerts** and buyer links, so they sell on the best day.

5%

spoils with a ChillPod, so farmers keep more of
their harvest

How KisanChill works

Harvest

Farmer picks the produce in the morning

Store

Brings it to the nearby ChillPod within hours

Track

App shows prices and the best day to sell

Sell

Buyer collects from the pod and the farmer
earns more

Runs on solar

no grid power needed

Pay per use

no big upfront cost for farmers

Local operator

a village entrepreneur runs each pod

Business Model and Farmer Impact

How we earn and why farmers are better off

KisanChill

Solar cold storage at the farm gate

How we earn

₹3 per kg

Storage fee per use
about 91% of revenue

2% commission

On produce sold via our buyer network
about 9% of revenue

Who we serve

- **Small farmers** with 1 to 5 acres of vegetables or fruit.
- **Farmer groups** (FPOs) and village co-operatives.
- **Buyers:** local traders, hotels and retailers who want fresh produce.

Why it works

- **Solar plus battery:** works in villages with weak power supply.
- **Pay per use:** farmers need no loan to start.
- **Local operator** earns a share, which builds trust.

Farmer earnings per 1,000 kg harvested (sample)

Without cold storage
20% spoils, sold at ₹10/kg

₹8,000

With ChillPod
5% spoils, sold at ₹14/kg

₹10,450 net income

fee
₹2,850

+31%

Assumes 20% spoilage and ₹10/kg at harvest peak versus 5% spoilage and ₹14/kg after a few days of storage, minus a ₹3/kg fee.

One ChillPod: yearly snapshot

Capacity	5 tonnes
Pod cost (solar + cooling)	₹9 lakh
Revenue per year	₹9.2 lakh
Running cost per year	₹3.6 lakh
Profit per year	₹5.6 lakh
Payback time	about 1.6 years

Assumes about 80 batches a year at 70% full (3,500 kg per batch).

Growth Plan, Finance and Funding

Three-year outlook and what we need to get started

KisanChill

Solar cold storage at the farm gate

Revenue, costs and profit (₹ crore)

Three-year snapshot

	Year 1	Year 2	Year 3
Pods installed (year-end)	20	80	200
Farmers served	2,000	8,000	20,000
Revenue (₹ Cr)	0.9	4.6	12.9
Costs (₹ Cr)	1.6	3.8	8.9
EBITDA (₹ Cr)	-0.7	0.8	4.0

Funding ask: ₹6 crore seed

- Pods (40 units) 60%
- Technology and app 15%
- Team and operations 15%
- Farmer onboarding 10%

Seed buys the first 40 pods. More pods are funded by bank loans and government agri-infrastructure schemes.

Team and partners

- Founder and CEO:** vision, funding and partnerships.
- Operations head:** pods, maintenance, local operators.
- Tech lead:** booking app, price alerts, pod sensors.
- Partners:** farmer groups, mandis, banks, state agri departments.
- Team size:** 10 in Year 1, 30 in Year 2, 60 in Year 3.

Key risks and fixes

Low use in off-season

Store many crops: vegetables, fruit, flowers, dairy.

High pod cost

Buy in bulk, use subsidies and asset-backed loans.

Farmers do not trust it

Free trial days and a trusted village operator.
